

### REMARKS

The symbol "Z" represents a bridging group as part of the structure of the alicyclic compounds used in forming the block copolymer of the present invention, as described on Pages 12-13 of the subject specification. By the teachings made on Page 13 and the illustrative examples, Z is a hydrocarbylene group and, thus, has a formula of  $-(C_tH_{2t})-$ . The present amendment is made to correct the typographical error of the definition formula and to make the claim terminology consistent with that made in the specification.

Respectfully submitted,

A handwritten signature in black ink, appearing to read 'Howard Trofkin', with a stylized flourish at the end.
